BUILDING PROJECTING PERIODICAL

Запорізька державна інженерна академія, кафедра ІМЛК

It is a reference book for professional builders and for those specialists who study and teach. It is a fortieth revised and updated edition with more than 6000 drawings and tables. In the light of the increasing responsibility of designers for the preservation of the environment, there're topics about construction biology and construction in the conditions of existing buildings, deepened and developed.

The content of many topics has been expanded, new sections have been updated, such as water treatment centers, beauty and health centers, as well as enterprises related to economic activities, for example, washing facilities. In principle, the concept of the division of landscape construction and the development of adjacent areas was developed in a new way, as this subject and architecture are becoming increasingly interconnected.

Many chapters have been updated and supplemented, for example, the adjacent territories, the theater, zoos and student hostels. Technical norms and legislative bases correspond to their actual state. The publication is intended for designers, architects-designers and students of architectural universities.

What are its main differences from the fortieth - "green", 39th - "burgundy" and 38th - "too blue" editions?

- understated format - 21.5 x 30 cm instead of 24.5 x 34.5 cm;
- 90 pages less - 500 versus 592 for the last fortieth - due to updates and additions from the publication to the publication;
- absence of subject index;
- another layout of the chapters, in particular, making it almost impossible to compare the content with later editions.

Fundamentals, norms, instructions for laying, building, decorating, necessary areas, the ratio of spaces, the size of the building, premises, facilities, equipment - together with the person and his interests.
